

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims**

1. (Currently Amended) An ultra-thin client network system, comprising:  
a processing center, including:
  - a processor;
  - a data bus in data communication with the processor;
  - a concurrency device, operatively coupled to the data bus, wherein the concurrency device enables sharing of the processor between a plurality of clients running separate applications on the processor;
  - a wireless data connection, operatively coupled to the concurrency device; and
  - a plurality of ultra-thin clients, each further comprising a communication device including a wireless data connection, whereby each of the ultra-thin clients can be in data communication with the concurrency device, and can be located in relation to the processing center without cabling, and can share in a processing capability of the processing center while running a separate application on the processor.
2. (Original) A system as set forth in claim 1, wherein at least one of the ultra-thin clients comprises at least one keyboard and at least one monitor operatively connected to the communication device of the ultra-thin client; whereby the ultra-thin client can comprise an I/O interface between a user and the processing center.
3. (Original) A system as set forth in claim 2, further comprising at least one of: a) a pointing device; b) a printer; c) a game console; d) a joystick; e) an image projector; f) an image capture device; g) a plotter; h) a scanner; and, i) an audio reproduction device.
4. (Original) A system as set forth in claim 3, wherein the system is configured for home use.
5. (Original) A system as set forth in claim 3, wherein the system is configured for use in one of: a) a workgroup; b) a business facility; and, c) an office.
6. (Original) A system as set forth in claim 1, where the processing center comprises a computer.
7. (Original) A system as set forth in claim 6, wherein the system is configured to

facilitate connection of a shared peripheral device.

8. (Original) A system as set forth in claim 7, further comprising a powered peripheral node (PPN) and including a wireless connection between the PPN and the processing center, said PPN facilitating connection of the said peripheral device for shared use by users on the network system.

9. (Original) A system as set forth in claim 7, further comprising a PPN wherein the PPN and shared peripheral device comprise a printer, power and data connections for the printer and at least one additional peripheral device and a power supply shared by the printer and the at least one additional peripheral device.

10. (Original) A system as set forth in claim 6, wherein the computer comprises a PC.

11. (Currently Amended) An ultra-thin client network system, comprising:  
a processing center, including a processor;  
a system bus connected to the processor;  
a concurrency device connected to the system bus wherein the concurrency device enables sharing of the processor between a plurality of clients running separate applications on the processor;  
a plurality of ultra-thin clients;  
a plurality of wireless data connections between the concurrency device and the plurality of ultra-thin clients;  
whereby the ultra-thin clients can be conveniently placed in wireless relation to the processor, and ~~use~~ can share the processing capability of the processor while running a separate application on the processor.

12. (Original) A system as set forth in claim 11, wherein the system is configured for use in a home environment.

13. (Original) A system as set forth in claim 12, wherein at least one of the ultra-thin clients is configured for use in a kitchen environment.

14. (Original) A system as set forth in claim 12, wherein at least one of the ultra-thin clients is configured primarily to facilitate entertainment.

15. (Original) A system as set forth in claim 12, wherein at least one of the ultra-thin

clients is configured to facilitate use in a home office environment.

16. (Original) A system as set forth in claim 14, wherein at least one of the ultra-thin clients is configured primarily to facilitate gaming.

17. (Original) A system as set forth in claim 11, further comprising a plurality of shared peripheral devices coupled to the processing center.

18. (Original) A system as set forth in claim 17, further comprising a PPN whereby at least two of the plurality of shared peripheral devices are connectable to the processing center.

19. (Original) A system as set forth in claim 18, wherein the PPN includes a printer as one of the shared peripheral devices.

20. (Original) A system as set forth in claim 18, wherein the PPN is wirelessly connectable to the processing center.

21. (Original) A system as set forth in claim 11, further comprising an Internet connection, whereby the processor can be in communication with the Internet and an ultra-thin client user can access the Internet.

22. (Original) A system as set forth in claim 11, wherein the system is configured for use in a commercial office environment.

23. (Original) A system as set forth in claim 22, wherein the processing center comprises a server.

24. (Original) A system as set forth in claim 23, further comprising a plurality of shared peripheral devices coupled to the processing center.

25. (Original) A system as set forth in claim 24, wherein the plurality of shared peripheral devices are located adjacent the processing center.

26. (Original) A system as set forth in claim 24, wherein at least one of the shared peripheral devices is remote from the processing center and connected to the processing center by a wireless data connection.

27. (Original) A system as set forth in claim 11, wherein the concurrency device and at least some wireless connection hardware are combined on a single card connectable to the system data bus.

28. (Original) A system as set forth in claim 27, wherein the wireless connection

hardware includes an antenna attached to said single card.

29. (Currently Amended) A method of providing an ultra-thin client network, comprising the steps of:

providing a processing center including a processor and a system bus;

providing for connecting a concurrency device to the system bus to enable connection of multiple ultra-thin clients to the processor;

providing for connection of the multiple ultra-thin clients to the processing center through the concurrency device to enable sharing of the processor by the multiple ultra-thin clients;

providing a wireless connection configured to enable data communication between the concurrency device and the multiple ultra-thin clients; and

configuring the concurrency device and the wireless connection so that the multiple ultra-thin clients can share the processor from remote locations without cabling via the concurrency device and the wireless connection to enable the ultra-thin clients to run separate applications on the processor.

30. (Original) A method as set forth in claim 29, further comprising the step of:  
enabling connection of a plurality of shared peripheral devices to the system data bus,  
whereby users of the ultra-thin clients can share the peripheral devices.

31. (Original) A method as set forth in claim 30, further comprising the steps of:  
providing a PPN; and  
configuring the PPN for connecting at least one of the plurality of peripheral devices to the processing center through the PPN.

32. (Original) A method as set forth in claim 31, further comprising the step of providing for wireless data communication between the PPN and the processing center.

33. (Original) A method as set forth in claim 30, comprising the further step of enabling wireless connection of a remote peripheral device to the processing center.

34. (Original) A method as set forth in claim 33, including the step of facilitating location of said remote peripheral device adjacent one of the ultra-thin clients.
